Platin / Minimax Pro rainwater harvesting system

Key Features: A complete rainwater harvesting tank and filter package that provides a sustainable and reliable non-potable water supply for toilets, washing machines, garden hoses, and more.

The Platin tank

Manufactured in Germany, the Platin flat tank is an underground storage system which collects rainwater for re-use in non-potable applications elsewhere in the home. In a direct set-up, water is pumped directly to the point-of-use (e.g. garden hose). In the case of an indirect system, water is fed to a header tank and then gravity-fed to the point-of-use (e.g. for toilet flushing).

The Minimax Pro filter

Designed to work in partnership with any Platin rainwater harvesting tank, Graf UK's unique Minimax Pro filter delivers optimum water savings, matched with ultimate ease of installation and minimal maintenance. The patented internal filter works by sieving debris (e.g. dirt and leaves) out of the incoming rainwater flow, using a self-cleaning stainless steel mesh insert. The system feeds filtered rainwater through to the Platin tank for storage and re-use, whilst any debris collected by the Minimax Pro filter flows into the property's drain. This ensures a water yield of more than 95%, whilst still removing foreign objects that would otherwise create blockages

The Rainwater Harvesting Package

Graf UK's complete Platin / Minimax Pro rainwater harvesting package allows consumers to save up to 50% on mains water use in the home and become more water efficient on an everyday basis. It also helps provide long-term protection against flooding.

Designed to hold up to 18 days' worth of rain, the large-capacity system means free and plentiful rainwater can be re-used for everyday non-potable applications inside and outside the home (including toilets, washing machines, garden hoses, and more). As well as lessening the burden on the mains water supply, cutting bills and lowering a home's environmental impact, the system also diverts stormwater away from the property's drains – reducing flood risk.

The Minimax Pro filter in particular delivers a water yield of more than 95%. This industry-leading filter efficiency means more rainwater is collected and filtered for reuse, further minimising water wastage

The unique design of Graf UK's Platin rainwater harvesting tanks mean that as well as providing a long-lasting water efficiency solution, they are easy to install and maintain – broadening the scope of applications and encouraging uptake across the UK.

[A large-capacity rainwater harvesting and storage system, this product shows that rainwater is a viable option for the future](#)

The Waterwise UK Water Efficiency Product Awards celebrate products and technology that contribute to water efficiency, which benefits the economy, society and environment.
